1.2 Physical Specifications

The following table defines the physical specifications.

Foundry	GLOBALFOUNDRIES

The following figure illustrates the physical specifications.

2 Global Parameters

This section provides a brief description of timing parameters.

2.1 Timing Parameters

The following figure illustrates the parameters related to timing measurements.

2.1.1 Propagation Delay

The delays are defined as the time between the input stimulus crossing 50% of VDD to the output crossing 50% of VDD.

2.1.2 Transition Delay

The transition delays/times are defined as time between the signal crossing 20% of VDD and 80% of VDD.

2.2 Constraints Parameters

2.2.1 Setup Time

The setup time for a sequential cell is the minimum time the data signal must be stable before clock signal's active edge/level arrives, to ensure correct functionality of cell.

2.2.2 Hold Time

The hold time for a sequential cell is the minimum time the signal must remain stable after the clock signal's active edge/level arrives, to ensure correct functionality of cell.

2.2.3 Recovery Time

Recovery time for a sequential cell is the minimum time the asynchronous signal must remain disabled before the arrival of active edge of clock signal, to ensure correct functionality of cell.

2.2.4 Removal Time

Removal time for a sequential cells is the minimum time the asynchronous signal must remain active after the active edge of clock signal arrived, to ensure correct functionality of cell.

2.2.5 Pulse Width

Pulse width for a sequential cell is the minimum time the signal must remain high or low to ensure correct functionality of cell.

Note: The library may contain negative delays. Most timing sign-off tools can handle negative delays, some will turn them into a zero value.

3 Reading the Datasheet

3.1 Sections in Datasheet

The following table defines the sections that may appear in your datasheets. Datasheet titles refers to standard INVECAS library cell names. Cell names for the specific library are reflected in the cell size table in each datasheet.

Note: For any shrink processes, all area numbers in the library and documentation are pre-shrink.

Sections	Description
Cell Description	The cell description provides the functionality of the cell. Wherever applicable, the equation(s) for the output pins are provided.
Area	The table gives the total area of the cell.
Symbol	The functional schematic provides a functional representation of cell.
Drive Strength	The drive strength of each cell is indicated by an 'X' followed by the strength factor.
Pin Capacitance	The pin capacitance table shows the typical loading at the input pins of the cell (pF).
Delay	The delay table shows the intrinsic delay (ns) of the gate and under standard load conditions.
Dynamic Energy	The energy table shows the amount of energy consumed (uW/ MHz) within the cell when the corresponding pin state changes.
Leakage Power	The cell leakage power table shows the average leakage power for each power level.
Timing Constraints	The timing constraints table shows timing conditions (ps) required at particular process, voltage and temperature, to maintain proper functionality. It includes Setup, Hold, Recovery, Removal, and Pulse Width constraints.

3.2 Symbols

The following symbols are used in datasheet, to represent the signal transition or state.

Symbols	Description
R	Low to High transition
F	High to Low transition
H	Logic 1
L	Logic 0
HiZ	High Impedance
